

FEATURE GUIDE FOR SCHOOLS

Everything a school runs on, in one login.

A cloud-based school management platform for private K-12 schools in Nigeria — student records, results, fees, computer-based testing and AI-assisted teaching, built to run on the phones, laptops and lab computers your school already owns.

DOCUMENT

Feature Guide v1

WRITTEN FOR

School owners & admins

BUILT FOR

Private K-12, Nigeria

HARDWARE REQUIRED

None

01 The platform at a glance

What it is, and how it thinks

SchoolPilot digitizes teaching, learning, administration, communication and examinations for private K-12 day schools — the 50-to-3,000-student schools currently running on paper, Excel or a rival portal. The whole system is **software-only**: no biometric readers, no RFID, no scanners, no sensors. Attendance uses the phone camera already in a teacher's pocket, and staff check in with their own phone's GPS. Your school can be live in about thirty minutes without buying a single piece of equipment.

4

Roles — Admin, Teacher, Student and Parent, each with their own login

1

App to install, whichever role you are — not four separate downloads

30_{min}

Guided setup, from an empty account to a running school

0

Devices to purchase, install, wire in or maintain

WHO USES IT

School Admin

Staff, students, parents, subjects, classes, timetables, fees, results and CBT — the whole office in one place.

Teacher

Attendance, scoring, homework, question banks, lesson planning and the AI drafting tools.

Student

Timetable, homework, CBT, released results, the AI tutor, points and badges.

Parent

Their child's attendance, fees owed, academic progress, notifications and teacher chat.

SIX COMMITMENTS BEHIND EVERY FEATURE

- 1 Software-only, always**
If it can't run on a standard phone camera, phone GPS or a browser, it doesn't ship. Hardware is a permanent boundary, not a later phase.
- 2 Nigerian K-12, not translated**
Sessions, terms, classes and exams — nursery through SS3. CA schemes, broadsheets, WAEC. No faculties, no semesters, no GPA.
- 3 It keeps working when the network doesn't**
Teachers mark a register and enter scores with no signal; the app queues the work and syncs it safely when the connection returns.
- 4 Nothing AI writes reaches a parent unreviewed**
Every AI-drafted remark waits for a teacher to approve or edit it. A report card cannot be printed with an unapproved comment on it.
- 5 NDPA-first, because the records are children's**
Nigeria's Data Protection Act 2023 is the standard we build to, with guardian consent captured at registration.
- 6 Your records stay yours**
A full export of your school's data is available on demand. Nothing about leaving is designed to be difficult.

WHAT THAT MEANS IN PRACTICE

YOUR DEVICES

The phones your staff already carry and the lab computers you already own. **Nothing to procure.**

YOUR CALENDAR

Sessions and terms, CA weightings you set yourself, promotion and repeat — **the way Nigerian schools actually run.**

YOUR JUDGEMENT

AI drafts; **teachers decide.** Every generated remark is held for review before it reaches a report card.

YOUR DATA

Medical and emergency fields **encrypted at rest**, guardian consent logged, and a full export whenever you ask.

FOUNDATION

Your own school portal

LIVE

Every school gets its own subdomain and fully isolated data — no other school can see a record of yours. A guided setup wizard walks an admin through subjects, classes and fee structures in roughly thirty minutes, designed to need no formal training.

Roles & permissions

LIVE

Four roles out of the box, plus custom role definitions for schools that split responsibilities differently — a bursar who should see finance but not medical notes, a form teacher who marks one class only.

Student records

LIVE

The full Nigerian registration form, digitized: biodata, passport photo, birth certificate reference, guardians (several per child, for split families), emergency contacts, state of origin, LGA, religion, blood group, allergies and previous school. Class history, promotion, repeat and transfer are kept as records rather than overwritten — academic history has legal value.

Staff & HR

LIVE

Staff profiles, qualifications, employment history, class and subject assignment, leave allocation and requests, and payroll runs — the administrative half of a school that portals routinely ignore.

THE DAILY LOOP

Academic structure

LIVE

Sessions, terms, classes and arms, subject catalogues and class-subject-teacher assignments — the skeleton every other module hangs from.

Attendance

LIVE

Students marked by QR scan through the app's own camera, or by roll call. Staff clock in with their own phone's GPS, checked against the school's gate coordinates. No reader, no fingerprint, no face.

Timetable engine

LIVE

Constraint-based scheduling produces a conflict-free master timetable in seconds, respects teacher availability and break rules, and saves each generation as a version you can compare or roll back.

What replaces the hardware

Every capability a competitor solves with a purchased device, SchoolPilot solves in software on equipment your school already owns. The right-hand column says plainly **where each one stands today** — the approach is settled for all of them, but only what is marked live is working software you can use now.

ASSUMED TO NEED HARDWARE	WHAT SCHOOLPILOT USES INSTEAD	STATUS
Attendance tracking	QR code scanned by the app's own camera, or a teacher mark	LIVE
Staff clock-in verification	The staff member's own phone GPS , checked against your gate	LIVE
Offline exam days	A downloadable desktop client on existing lab computers	BUILDING
Bus tracking	The driver's phone , broadcasting only while a route is active	PLANNED
Library check-in / out	Phone camera scanning a printed barcode , or manual entry	PLANNED
ID cards	A generated, printable PDF — any print shop or office printer	PLANNED
"Smart" classroom features	Live video and whiteboard through the browser , not smartboards	PLANNED

Result processing is where the manual alternative is most painful. Compilation that costs a school days of a bursar's and form teacher's time collapses into a background job — and the report card that comes out the other end can be verified as genuine by anyone holding it.

RESULTS

CA schemes you configure

LIVE

Schools weight continuous assessment against exams differently, so the scheme is something you set, not something we fix. Grade boundaries are yours too. Scores enter by single form or by bulk spreadsheet upload — the CSV any school can export from Excel.

Compilation & broadsheets

LIVE

Automatic grade computation, class ranking and whole-class broadsheet views. Heavy compilation and PDF rendering run as background jobs you can track, never as a page that hangs while forty report cards render.

Your own report card design

LIVE

Schools import their own report card layout — your crest, your sections, your remark blocks — rather than accepting one fixed house style.

QR authenticity verification

LIVE

Every generated report card carries a QR code. A parent, a receiving school or an employer can scan it and confirm on the spot that the document is genuine and unaltered.

Result access by PIN

LIVE

Issue result-checker PINs in batches and track redemption — the scratch-card model Nigerian parents already understand, issued digitally instead of printed and never lost in a drawer.

You decide when results go out

LIVE

Results reach students and parents only when your school releases them for a term, so a half-entered broadsheet can never leak out as a finished result.

An AI comment never reaches a report card unreviewed

SchoolPilot drafts personalized teacher remarks from a student's actual score data — but every draft lands in **pending approval** and stays there until a teacher reads it and either approves or edits it. The PDF generator refuses to print an unapproved comment. A hallucinated or oddly-worded remark about a specific child is a real reputational risk, and this gate is the deliberate answer to it.

COMPUTER-BASED TESTING

CBT exam engine

LIVE

WAEC, NECO and JAMB-aligned delivery: question and option shuffling, timed sessions, instant objective grading, negative marking and pass marks. Session events are logged for integrity review.

- Images inside questions and options
- Maths equations rendered without internet
- Per-topic score breakdown

Question bank

LIVE

Unlimited bank tagged by subject, topic and difficulty, aligned to WAEC/NECO/JAMB, with bulk import so the questions your teachers have already written aren't stranded in Word.

- Images attached per question
- Reusable across exams and terms

Offline exam client

IN DEVELOPMENT

Exam day rarely comes with reliable internet. A downloadable client for your existing lab computers is being built now.

The server side it plugs into is already in place: papers can be marked available offline, question images pre-download the day before, and answers reconcile on sync so an interrupted upload can't lose or duplicate a paper.

AI, IN TWO PLACES IT EARNs ITS KEEP

AI Studio — teacher tools

LIVE

Curriculum-aligned lesson plans complete with objectives, activities and assessment strategy; exam and homework generation; performance summaries drafted from a student's real scores; and translation support for teachers working across languages.

Curriculum context is injected into every prompt, so output lands on the Nigerian syllabus rather than a generic international one.

AI Learning Hub — student tutor

LIVE

A round-the-clock conversational tutor scoped to what the student's *own* teacher actually set — not a generic public chatbot. Conversation history persists between sessions, so a student picks up where they left off.

Every exchange feeds topic mastery, which shows a teacher where a class is quietly falling behind.

Topic mastery

LIVE

Per-student, per-topic mastery scores, built from tutor sessions and test performance rather than guessed at.

Points, streaks & badges

LIVE

Light gamification that gives a fourteen-year-old a reason to come back tomorrow, without turning school into a game show.

Performance summaries

LIVE

A plain-language summary of how a student is doing, drafted for a teacher or a parent meeting and reviewable before it's shared.

Every AI feature has an off switch, and you hold it

AI is not all-or-nothing and it is not imposed. A school admin can disable AI entirely, or switch off individual features one at a time — report comments, lesson plans, exam generation, homework ideas, translation, performance summaries and the student tutor are each their own toggle. A school that wants lesson planning but not a student-facing tutor simply turns the tutor off, and **no student data is sent for a feature you have disabled**.

FEES, FINANCE & ACCOUNTING

Fee structures & invoicing

LIVE

A flexible fee-structure builder drives automated invoicing per class and term, with itemized invoices, receipt printing, and a defaulter list that answers "who hasn't paid" without a spreadsheet.

- Instalment plans that must add up to the balance
- Scholarships and discounts

Payments

LIVE

Paystack and Flutterwave, configured per school. Online payments reconcile against invoices automatically, and cash and bank transfers are logged through the same ledger so the bursar has one set of books.

Full school accounting

LIVE

Beyond fee collection: expense tracking, vendor records, petty cash, budgets and payroll — so the bursar's office runs inside the same system as the classroom rather than beside it in Excel.

Fee reminders that don't harass

LIVE

Reminders to parents with an outstanding balance, throttled deliberately — three texts in a row reads as harassment. Push is free and SMS is billed, so the channel is always a choice the bursar makes, never a silent default.

REACHING PARENTS AND STUDENTS

Parent portal

LIVE

A parent sees their child's attendance, fees due, academic progress, notifications and school events — and where a family is split across households, each guardian gets their own access to the same child.

Pickup authorization records who is permitted to collect a child, kept as data rather than a note at the gate.

Messaging & notifications

LIVE

Threaded parent-teacher messaging, push notifications to registered devices, a delivery log for every notification sent, and SMS for the messages that have to arrive on a feature phone.

Homework & submissions

LIVE

Teachers set homework, students submit through web or mobile, and submissions are graded in the same place the scores already live — closing the loop back into the CA scheme.

Portfolio & behaviour

LIVE

A student portfolio of work and achievements alongside behaviour reports, so the record your school keeps on a child isn't only a column of numbers.

INSIGHT, SECURITY & COMPLIANCE

Analytics & alerts

LIVE

Grade-drop alerts that flag a child slipping before the term ends, revenue forecasting from your own payment patterns, and attrition-risk signals. Admin dashboards surface population, revenue, attendance rate and what's waiting for approval.

Security baseline

LIVE

Encryption in transit and at rest, plus **field-level encryption** on blood group, allergies, medical notes and emergency contacts — unreadable even from a raw database copy. Two-factor authentication, audit logs, login history and rate limiting.

NDPA compliance

LIVE

Guardian consent is captured at registration with timestamp and IP, and is withdrawable without breaking records your school is separately obliged to retain. A full data export is available on demand — you can always leave with everything.

No biometrics is a compliance decision, not only a cost one

Biometric data is a stricter category of sensitive personal data under NDPA, as under most frameworks. By never collecting it, your school sidesteps an entire tier of consent and security obligation that a biometric-attendance system would hand you — **one less compliance burden, on top of the hardware saving.**

WHERE IT RUNS

Web portal

LIVE

Built for the staff-heavy work: bulk score entry, finance reports, CBT authoring, setup and analytics — the jobs nobody wants to do on a phone.

One mobile app

LIVE

A single app with role-based navigation for admin, teacher, student and parent — not four separate apps to install, update and explain.

Works without signal

LIVE

A teacher marks a register or enters scores with no connection; the app queues the work locally and syncs when signal returns. Repeated retries can't double-post, and a pending-sync screen shows exactly what hasn't landed yet.

Everything in the left-hand column is working software today — every feature described in this guide carries the same status badge on its card. The middle column is what we are building now. The right-hand column is planned and not yet started, and is marked that way **so you never have to guess which is which.**

AVAILABLE NOW Working today	BEING BUILT NOW In development	PLANNED Not built yet
• Your own school portal & guided setup • Student records & guardians • Staff, HR & payroll • Sessions, terms, classes, arms • QR & roll-call attendance • Staff GPS clock-in • Timetable generation with versions • CA schemes, broadsheets, ranking • QR-verified report cards, your design • Result PINs & release control • Online CBT with images & equations • Question bank with bulk import • AI Studio & AI tutor, teacher-approved • Fees, invoicing, Paystack & Flutterwave • Accounting, payroll & budgets • Parent portal, messaging, push & SMS • Analytics, 2FA, audit logs, export • Web portal + mobile app that works offline	• Offline exam client — a downloadable client for your existing lab computers, so exam day survives a dead internet connection • Rubric-based grading • Peer review on assignments • Richer CBT question types — drag-and-drop, diagram labeling, negative-marking variants • NABTEB, Cambridge & Montessori tagging • Multilingual tutor — Yoruba, Hausa, Igbo, French • In-app chat & discussion forums • Leaderboards & certificates • Lesson content uploads: PDF, video, audio • HR appraisals & certificate tracking	• Transport — GPS bus tracking from the driver's own phone, active only while a route runs • Library — catalog, borrowing, due dates and reservations; barcodes read by phone camera • Hostel — room and bed allocation, visitor logs, maintenance tickets, hostel fees • Health — medical records, clinic visits, vaccination tracking, incident reports • Live classes — Zoom/Meet integration with schedule and attendance sync • Full international-curriculum support for dual-curriculum schools

Permanently out of scope

Facial recognition. Fingerprint and biometric scanners. RFID readers and RFID ID cards. Barcode-scanner guns. Dedicated vehicle GPS units. IoT classroom sensors, smart boards, digital bell systems, smart lockers. VR and AR headsets. These are not deferred to a later phase — they are excluded. Every one of them turns being live this week into a multi-week hardware rollout, in a market whose schools run on tuition income and inconsistent power. If a school ever genuinely needs a hardware-backed "smart campus", that is a different product, not a phase of this roadmap.

Everything your front office, classroom and finance office need — in one login.

Running on the phones, laptops and lab computers **you already own.**
